# ACKNOWLEDGMENTS

This report is primarily an updated version of the fifth edition of *Montana Historical Energy Statistics*, prepared by Lynda Steele in 1984. The most recent data were compiled by Nancy McLane, research specialist in the Energy Division, DNRC. Dan Vichorek edited the report; June Virag prepared the figures; Barbara Lien did the typesetting and layout; and Emelia Satre handled the word processing.

In addition, many individuals from private organizations, utilities, and government agencies provided data for this publication.

# CONTENTS

INTRODUCTION .....	1
ABBREVIATIONS AND ACRONYMS .....	3
ENERGY CONVERSION FACTORS .....	5
GLOSSARY .....	7
1. ENERGY PRODUCTION AND CONSUMPTION .....	13
1.1 Production of Energy by Type of Fuel (physical units), 1960-87 .....	14
1.2 Production of Energy by Type of Fuel (trillion Btu), 1960-87 .....	16
1.3 Consumption of Energy by Type of Fuel (physical units), 1960-87 .....	18
1.4 Consumption of Energy by Type of Fuel (trillion Btu), 1960-87 .....	20
1.5 Consumption of Energy by Sector (trillion Btu), 1960-87 .....	21
1.6 Residential Energy Consumption Estimates, 1960-87 .....	22
1.7 Commercial Energy Consumption Estimates, 1960-87 .....	23
1.8 Industrial Energy Consumption Estimates, 1960-87 .....	24
1.9 Transportation Energy Consumption Estimates, 1960-87 .....	25
2. ELECTRICITY .....	27
2.1 Electric Power Plants by Primary Fuel, 1989 .....	28
2.2 Net Electric Energy Generation by Type of Fuel Unit, 1950-87 .....	32
2.3 Monthly Sales of Electricity to Ultimate Consumers, 1960-88 .....	34
2.4 Annual Sales of Electricity by Class of Service, 1950-87 .....	38
2.5 Average Annual Prices for Electricity Sold by Class of Service, 1950-87 .....	39
2.6 Monthly Consumption of Fuels by Electric Utilities, 1960-88 .....	40
2.7 Typical Electric Bills for Residential Service, 1980-88 .....	42
2.8 Typical Monthly Electric Bills for Commercial Service, 1975-88 .....	44
2.9 Typical Monthly Electric Bills for Industrial Service, 1975-88 .....	45
3. COAL .....	47
3.1 Demonstrated Reserve Base of Coal by Rank, January 1, 1988 .....	48
3.2 Coal Production by Company, 1978-88 .....	49
3.3 Coal Production by County, 1950-88 .....	50
3.4 Average Mine Price of Coal by County, 1950-88 .....	52
3.5 Coal Production and Average Mine Price by Rank of Coal, 1950-87 .....	54
3.6 Receipts of Montana Coal at Electric Utility Plants, 1973-87 .....	55
3.7 Destination of Montana Coal Delivered to Steam-Electric Plants, 1978-87 .....	56
3.8 Distribution of Coal for Use in Montana, 1974-88 .....	57
4. NATURAL GAS .....	59
4.1 Year-End Natural Gas Proved Reserves, 1950-79 .....	60
4.1A Year-End Proved Reserves of Natural Gas and Natural Gas Liquids, 1976-87 .....	61
4.2 Production and Average Wellhead Price of Natural Gas, 1950-88 .....	62
4.3 Sales of Natural Gas, 1950-87 .....	63
4.4 Average Prices of Natural Gas, 1950-87 .....	65

4.5	Sales of Natural Gas by Gas Utilities, 1950-88 .....	66
4.6	Natural Gas Production and Consumption, 1950-87 .....	69
4.7	Average Annual Natural Gas Prices, 1950-87 .....	70
4.8	Capacity and Production of Natural Gas Processing Plants, 1961-87 .....	71
4.9	Producing Gas and Gas Condensate Wells, 1966-87 .....	72
4.10	Average Natural Gas Consumption and Annual Cost Per Consumer, 1980-87 .....	73
<b>5.</b>	<b>CRUDE OIL AND PETROLEUM PRODUCTS .....</b>	<b>75</b>
5.1	Year-End Proved Reserves of Crude Oil, 1950-87 .....	76
5.2	Estimates of Crude Oil Proved Reserves by Region, 1955-88 .....	78
5.3	Crude Oil Production and Average Wellhead Prices, 1950-87 .....	79
5.4	Total Refinery Receipts by Source of Crude Oil, 1953-88 .....	80
5.5	Motor Fuel Use, 1950-87 .....	82
5.6	Monthly Gasohol Consumption, 1980-87 .....	83
5.7	Petroleum Product Consumption Estimates, 1960-87 .....	84
5.8	Residential Petroleum Product Consumption Estimates, 1960-87 .....	85
5.9	Commercial Petroleum Product Consumption Estimates, 1960-87 .....	86
5.10	Industrial Petroleum Product Consumption Estimates, 1960-87 .....	87
5.11	Transportation Petroleum Product Consumption Estimates, 1960-87 .....	88

## FIGURES

1.1	Production and Consumption of Energy, 1960-87 .....	15
1.2	Production of Energy by Type of Fuel, 1960-87 .....	17

2.1	Annual Generation of Electricity, 1960-87 .....	31
2.2	Annual Sales of Electricity, 1960-88 .....	33
2.3	Annual Generation and Sales of Electricity, 1960-87 .....	37
4.1	Sales of Natural Gas by Consuming Sector, 1960-87 .....	64
5.1	Crude Oil Production, 1943-88 .....	77
5.2	Refinery Receipts by Source of Crude Oil, 1960-87 .....	81

# INTRODUCTION

The *Montana Historical Energy Statistics* is a compilation of energy reserves, sales, consumption, and production data gathered from state, federal, and private sources. The statistics in this report are organized as follows: Chapter 1 presents Montana's total energy production and consumption of energy resources, broken down by fuel type and by sector. Chapters 2-5 contain more detailed statistics grouped by fuel type (electricity, coal, natural gas, and petroleum). Prefacing each chapter are highlights which depict changes from the previous year.

The reader is cautioned against data comparisons between tables drawn from different sources. First, this report uses definitions developed by DOE for the residential, commercial, industrial, transportation, and electric utility end-use sectors. These sector definitions are not necessarily the same as those used by other data sources. Second, in some instances, two sources may show markedly different figures for basically the same data item. Such discrepancies are the result of differences in data collection methods and reporting procedures. The *Montana Historical Energy Statistics* recognizes that these differences exist, but, in general, does not include explanations for the differences. Readers needing detailed explanations of the definitions, data collection methods, etc., should refer to the original data sources or contact the Energy Division for further explanation.

Sales of energy products do not necessarily indicate consumption of those products. Some forms of energy may be added to storage facilities during the reporting period, causing sales to exceed consumption. Similarly, actual consumption may exceed sales if stockpiles are reduced by withdrawals from storage.

When DOE changes its reporting procedures or estimation methods, data from previous years are often revised to provide a time series of reasonably comparable data. For the purposes of this document, individual figures or years of data have been revised according to the most recently published information. In most cases, however, these revisions are not noted in the tables.

In some cases, individual data entries do not add to the printed totals. This can occur when the individual items have been rounded independently of the totals, or when the totals are based on unpublished revisions of the individual entries. (For example, many federal publications are published both monthly and annually, but the annual figures reflect unpublished additions, corrections, and revisions to the monthly data.) In such cases, the reader should consider the individual data entries indicative of the measurement in question rather than definitive.

DOE source publications often change the units in which data are reported; for example, DOE may change from reporting natural gas in millions of cubic feet to billions of cubic feet. Rather than revising the entire data series to reflect such a change, the *Montana Historical Energy Statistics* generally retains the original reporting units, appending zeros as necessary. For this reason, trailing zeros in figures should be considered place holders rather than significant digits.

The compilation of this publication was completed in September 1989. The most current data available at the time were used. Final energy data compiled by the U.S. Department of Energy typically are not published until 10-12 months after the end of the year.

Comments, corrections, suggestions, and requests for assistance as they apply to this publication should be addressed to the Energy Division, Department of Natural Resources and Conservation, 1520 E. Sixth Avenue, Helena, Montana 59620; telephone (406) 444-6697.

# ABBREVIATIONS AND ACRONYMS

AGA	American Gas Association
bbl	Barrel
Bcf, bcf	Billion cubic feet
Btu	British thermal unit
DNRC	Montana Department of Natural Resources and Conservation
DOE	U.S. Department of Energy
DRB	Demonstrated reserve base
E	Estimated figure
EIA	U.S. Department of Energy, Energy Information Administration
FERC	Federal Energy Regulatory Commission
GW	Gigawatt
GWh	Gigawatt-hour
HES	Montana Historical Energy Statistics
kW	Kilowatt
kWh	Kilowatt-hour
LNG	Liquefied natural gas
LPG	Liquefied petroleum gas
Mcf, mcf	Thousand cubic feet
MDU	Montana-Dakota Utilities
MEC	Montana Energy Council
Mbbl	Thousand barrels
MMcf	Million cubic feet
MPC	Montana Power Company
Mtons	Thousand short tons
MW	Megawatt
MWh	Megawatt-hour
NA	Not available
NGL	Natural gas liquids
P	Preliminary figure
PPL	Pacific Power and Light Company
PSC	Montana Public Service Commission
psia	Pounds per square inch absolute
PSP&L	Puget Sound Power and Light Company
R, r	Revised
SIC	Standard Industrial Classification (code)
t	(Short) ton
TBtu	Trillion British thermal units
w	Withheld to avoid disclosure of individual company data
W	Watt
Wh	Watt-hour
WWP	Washington Water Power Company

# ENERGY CONVERSION FACTORS

Fuel	Approximate Btu Content
Coal:	
Anthracite (U.S. average)	25,400,000 Btu/short ton
Bituminous (U.S. average)	23,650,000 Btu/short ton
Subbituminous (Montana)	17,500,000 Btu/short ton
Lignite (Montana)	13,000,000 Btu/short ton
(Dry) Natural gas	1,000 Btu/cubic foot
Crude oil	5,610,000 Btu/barrel
Refined petroleum products:	
Motor gasoline	5,250,000 Btu/barrel
Distillate fuel oil	5,830,000 Btu/barrel
Residual fuel oil	6,290,000 Btu/barrel
Kerosene	5,670,000 Btu/barrel
Liquefied petroleum gases (propane-butane mix)	4,011,000 Btu/barrel
Lubricants	6,070,000 Btu/barrel
All products (average)	5,520,000 Btu/barrel
Electricity	3,412 Btu/kilowatt-hour

NOTE. This table shows the conversion factors used by DNRC's Energy Division. The U.S. Department of Energy uses slightly different values for the approximate heat content of various fuels. These values are based, in part, on the average Btu value of fuels burned nationwide in a particular year. (For example, the moisture content of anthracite coal affects its heat content; DOE uses the average Btu value of anthracite burned in the United States in a given year as the approximate heat content of anthracite coal for that year.)

Extensive tables showing the approximate heat content of various fuels over the past ten years can be found in the U.S. Department of Energy, Energy Information Administration's publication, *Monthly Energy Review* (EIA-0035)

# GLOSSARY

**Average Megawatt:** A unit of energy output over a specified time period. It is equivalent to the total energy in megawatt-hours divided by 8,760 (the number of hours in a year).

**Average Mine Price:** The ratio of the total value of the coal produced at the mine to the total production tonnage (See **F.O.B. Mine Price**).

**Barrel:** A volumetric unit of measure for crude oil and petroleum products equivalent to 42 U.S. gallons.

**Bcf:** One billion cubic feet.

**Btu (British Thermal Unit):** A standard unit for measuring the quantity of heat required to raise the temperature of 1 pound of water by 1 degree Fahrenheit (F).

**Capacity:** Amount of electric power delivered or required for which a generator, turbine, transformer, transmission circuit, station, or system is rated.

**Coal:** A black or brownish-black solid combustible substance formed by the partial decomposition of vegetable matter without free access to air and under the influence of moisture and, often, increased pressure and temperature. The rank of coal (anthracite, bituminous, subbituminous, and lignite) is determined by its heating value.

**Anthracite:** Hard and jet black with a high luster, it is the highest rank of coal and is mined in northeastern Pennsylvania. Anthracite contains approximately 22 to 28 million Btu per ton as received.

**Bituminous:** The most common coal, it is soft, dense, and black with well-defined bands of bright and dull material. Bituminous is ranked between anthracite and subbituminous and is mined chiefly in Kentucky, Pennsylvania, and West Virginia. The heating value ranges from 19 to 30 million Btu per ton as received.

**Lignite:** A brownish-black coal of the lowest rank; it is mined in North Dakota, Montana, and Texas. The heat content of lignite ranges from 9 to 17 million Btu per ton as received.

**Subbituminous:** A dull black coal ranking between lignite and bituminous; it is mined chiefly in Montana and Wyoming. The heat content of sub-

bituminous coal ranges from 16 to 24 million Btu per ton as received.

**Coal Bed:** A bed or stratum of coal. Also called a **coal seam**.

**Coal Rank:** A classification of coal based on fixed carbon, volatile matter, and heating value.

**Demand:** The rate at which electric energy is delivered to or by a system, part of a system, or piece of equipment at a given instant or averaged over any designated period of time. (See **Load**).

**Demonstrated Reserve Base:** A collective term for the sum of coal in both measured and indicated resource categories of reliability that represents 100 percent of the coal in these categories in-place as of a certain date. Includes beds of bituminous coal and anthracite 28 or more inches thick and beds of subbituminous coal 60 or more inches thick that occur at depths to 1,000 feet. Includes beds of lignite 60 or more inches thick that can be surface mined. Includes also thinner and/or deeper beds that presently are being mined or for which there is evidence that they could be mined commercially at this time. Represents that portion of the identified coal resource from which reserves are calculated.

**Distillate Fuel Oil:** A general classification for one of the petroleum fractions produced in conventional distillation operations. It is used primarily for space heating, on-and-off-highway diesel engine fuel (including railroad engine fuel and fuel for agricultural machinery), and electric power generation. Included are products known as No. 1, No. 2 and No. 4 fuel oils; No. 1, No. 2, and No. 4 diesel fuel.

**End-Use Sectors:** Energy use is assigned to the major end-use sectors according to the following guidelines as closely as possible:

**Residential sector:** Energy consumed by private household establishments primarily for space heating, water heating, air conditioning, cooking, and clothes drying.

**Commercial sector:** Energy consumed by non-manufacturing business establishments, including motels, restaurants, wholesale businesses, retail stores, laundries, and other service enterprises; by health, social, and educational institutions; and by federal, state, and local governments.

**Industrial sector:** Energy consumed by manufacturing, construction, mining, agriculture, fishing, and forestry establishments.

**Transportation sector:** Energy consumed to move people and commodities in both the public and private sectors, including military, railroad, vessel bunkering, and marine uses, as well as the pipeline transmission of natural gas.

**Electric utility sector:** Energy consumed by privately and publicly owned establishments that generate electricity primarily for resale.

**Extraction Loss:** The reduction in volume of natural gas resulting from the removal of natural gas liquid constituents at natural gas processing plants.

**Feedstock:** Natural gas used as a raw material for its nonfuel chemical properties in creating an end product.

**F.O.B. Mine Price:** The “free on board” mine price. This is the price paid for coal measured in dollars per short ton at the mining operation site and, therefore, does not include freight/shipping and insurance costs.

**Fossil Fuel:** Any naturally occurring fuel of an organic nature, such as coal, crude oil, and natural gas.

**Fossil Fuel Plant:** A plant using coal, oil, gas or other fossil fuel as its source of energy.

**Fuel:** Any substance that can be burned to produce heat; it sometimes includes materials that can be fissioned in a chain reaction to produce heat.

**Gas Condensate Well:** A gas well that produces from a gas reservoir containing considerable quantities of liquid hydrocarbons in the pentanes and heavier range generally described as “condensate.”

**Gas Well:** A well that is completed for the production of gas from either nonassociated gas reservoirs or associated gas and oil reservoirs.

**Gasohol:** A blend of finished motor gasoline (leaded or unleaded) and alcohol (generally ethanol but sometimes methanol) in which 10 percent or more of the product is alcohol.

**Generation (Electric):** The act or process of producing electric energy from other forms of energy; also, the amount of electric energy produced, expressed in watt-hours (Wh).

**Gross:** The total amount of electric energy produced by the generating units in a generating station or stations, measured at the generator terminals.

**Net:** Gross generation less the electric energy consumed at the generating station for station use. (Energy required for pumping at pumped-storage plants is regarded as plant use and is subtracted from the gross generation and from hydroelectric generation.)

**Gigawatt (GW):** One billion watts.

**Gigawatt-hour (GWh):** One billion watt-hours.

**Gross Withdrawals:** Full well stream volume excluding condensate separated at the lease.

**Horsepower:** A unit of power equal to 746 watts.

**Hydroelectric Power Plant:** A plant in which the turbine generators are driven by falling water.

**Identified Resources:** Coal deposits whose location, rank, quality, and quantity are known from geologic evidence supported by engineering measurements. Included are beds of bituminous coal and anthracite 14 or more inches thick and beds of subbituminous coal and lignite 30 or more inches thick that occur at depths to 6,000 feet. The existence and quantity of these beds have been delineated within specified degrees of geologic assurance as measured, indicated, or inferred. Also included are thinner and/or deeper beds that presently are being mined or for which there is evidence that they could be mined commercially.

**Indicated Resources:** Coal for which estimates of the rank, quality, and quantity have been computed partly from sample analyses and measurements and partly from reasonable geologic projections. Indicated resources are computed partly from specified measurements and partly from projection of visible data for a reasonable distance on the basis of geologic evidence. The points of observation are  $\frac{1}{2}$  to  $1\frac{1}{2}$  miles apart. Indicated coal is projected to extend as a  $\frac{1}{2}$ -mile-wide belt that lies more than  $\frac{1}{4}$  mile from the outcrop or points of observation or measurement.

**Inferred Resources:** Coal in unexplored extensions of demonstrated resources for which estimates of the quality and size are based on geologic evidence and projection. Quantitative estimates are based largely on broad knowledge of the geologic character of the bed or region and where few measurements of bed thickness are available. The estimates are based primarily on an assumed continuation from demonstrated coal for which

there is geologic evidence. The points of observation are 1½ to 6 miles apart. Inferred coal is projected to extend as a 2¼-mile-wide belt that lies more than ¾ mile from the outcrop or points of observation or measurement.

**Installed Nameplate Capacity:** The capacity as shown on the manufacturer's identification plate. This appears on apparatus, such as generating units, turbines, or other equipment in a station or system. Installed station capacity does not include auxiliary or house units. The nameplate capacity is the full-load continuous rating of a generator, prime mover, or other electrical equipment under specified conditions as designated by the manufacturer. It is usually indicated on a nameplate attached mechanically to the equipment.

**Kerosene:** A petroleum distillate that boils at a temperature between 300-550 degrees F, that has a flash point higher than 100 degrees F, that has a gravity range from 40-46 degrees API, and that has a burning point in the range of 150-175 degrees F. Included are the two classifications, No. 1-K and No. 2-K, and all grades of kerosene called range or stove oil which have properties similar to No. 1 fuel oil, but with a gravity of about 43 degrees API and a maximum end-point of 625 degrees F. Kerosene is used in space heaters, cook stoves, and water heaters and is suitable for use as an illuminant when burned in wick lamps.

**Kilowatt (KW):** One thousand watts.

**Kilowatt-hour (kWh):** One thousand watt-hours.

**Lease Condensate:** A natural gas liquid recovered from gas well gas (associated and nonassociated) in lease separators or natural gas field facilities. Lease condensate consists primarily of pentanes and heavier hydrocarbons.

**Liquefied Natural Gas (LNG):** Natural gas that has been liquefied by reducing its temperature to minus 260 degrees F at atmospheric pressure.

**Liquefied Petroleum Gases (LPG):** Propane, propylene, butanes, butylene, butane-propane mixtures, ethane-propane mixtures, and isobutane produced at refineries or natural gas processing plants, including plants that fractionate raw natural gas plant liquids.

**Load (Electric):** The amount of electric power delivered or required at any specific point or points on a system.

**Marketed Production:** Gross withdrawals less gas used for repressuring, quantities vented and flared, and

nonhydrocarbon gases removed in treating or processing operations.

**Mcf:** One thousand cubic feet.

**Measured Resources:** Coal for which estimates of the rank, quality, and quantity have been computed, within a margin of error of less than 20 percent, from sample analyses and measurements from closely spaced and geologically well-known sample sites. Measured resources are computed from dimensions revealed in outcrops, trenches, mine workings, and drill holes. The points of observation and measurement are so closely spaced and the thickness and extent of coals are so well defined that the tonnage is judged to be accurate within 20 percent. Although the spacing of the points of observation necessary to demonstrate continuity of the coal differs from region to region according to the character of the coalbeds, the points of observation are no greater than ½ mile apart. Measured coal is projected to extend as a ¼-mile belt from the outcrop or points of observation or measurement.

**Megawatt (MW):** One million watts.

**Megawatt-hour (MWh):** One million watt-hours.

**MMcf:** One million cubic feet.

**Natural Gas:** A mixture of hydrocarbon compounds and small quantities of various nonhydrocarbons existing in the gaseous phase or in solution with crude oil in natural underground reservoirs at reservoir conditions. The principal hydrocarbons usually contained in the mixture are methane, ethane, propane, butane, and pentanes. Typical nonhydrocarbon gases that may be present in reservoir natural gas are carbon dioxide, helium, hydrogen sulfide, and nitrogen. Under reservoir conditions, natural gas and the liquefiable portions occur either in a single gaseous phase in the reservoir or in solution with crude oil, and are not distinguishable at the time as separate substances.

**Natural Gas—Associated-Dissolved:** The combined volume of natural gas that occurs in crude oil reservoirs either as free gas (associated) or as gas in solution with crude oil (dissolved).

**Natural Gas—Dry:** The actual or calculated volumes of natural gas that remain after the liquefiable hydrocarbon portion has been removed from the gas stream (i.e., gas after lease, field, and/or plant separation), and any volumes of nonhydrocarbon gases have been removed where they occur in sufficient quantity to render the gas unmarketable.

**Natural Gas—Nonassociated:** Natural gas not in contact with significant quantities of crude oil in a reservoir.

**Natural Gas—Wet After Lease Separation:** The volume of natural gas remaining after removal of lease condensate in lease and/or field separation facilities, if any, and after exclusion of nonhydrocarbon gases where they occur in sufficient quantity to render the gas unmarketable. Natural gas liquids may be recovered from volumes of natural gas, wet after lease separation, at natural gas processing plants.

**Natural Gas Liquids:** Those hydrocarbons in natural gas that are separated from the gas through the processes of absorption, condensation, adsorption, or other methods in gas processing or cycling plants. Generally, such liquids consist of propane and heavier hydrocarbons and are commonly referred to as condensate, natural gasoline, or liquefied petroleum gases. Where hydrocarbon components lighter than propane are recovered as liquids, these components are included with natural gas liquids.

**Natural Gas Plant Liquids:** Natural gas liquids recovered from natural gas in gas processing plants, and in some situations, from natural gas field facilities. Natural gas liquids extracted by fractionators are also included. These liquids are classified as follows: ethane, propane, ethane-propane mix, isobutane, butane, butane-propane mix, isopentane, natural gasoline, plant condensate, unfractionated stream, and other products from natural gas processing plants (i.e., products meeting the standards of finished petroleum products produced at natural gas processing plants, such as finished motor gasoline, finished aviation gasoline, special naphthas, kerosene, distillate fuel oil, and miscellaneous products).

**Petroleum:** A generic term applied to oil and oil products in all forms, such as crude oil, lease condensate, unfinished oil, refined petroleum products, natural gas plant liquids and non-hydrocarbon compounds blended into finished petroleum products.

**Petroleum Products:** Petroleum products are obtained from the processing of crude oil (including lease condensate), natural gas, and other hydrocarbon compounds. Petroleum products include unfinished oils, natural gasoline and isopentane, plant condensate, unfractionated stream, liquefied petroleum gases, aviation gasoline, motor gasoline, naphtha-type jet fuel, kerosene-type jet fuel, kerosene, distillate fuel oil, residual fuel oil, naphtha less than 400°F end-point, other oils over 400°F end-point, special naphthas, lubricants,

waxes, petroleum coke, asphalt, road oil, still gas, and miscellaneous products.

**Petroleum Refinery:** An installation that manufactures finished petroleum products from crude oil, unfinished oils, natural gas liquids, other hydrocarbons, and alcohol.

**Proved Reserves of Crude Oil:** Proved reserves of crude oil, as of December 31 of the report year, are the estimated quantities of all liquids defined as crude oil that geological and engineering data show with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions.

Reservoirs are considered proved if economic producibility is supported by actual production or conclusive formation test (drill stem or wire line), or if economic producibility is supported by core analyses and/or electric or other log interpretations.

**Proved Reserves of Natural Gas:** Proved reserves of natural gas, as of December 31 of the report year, are the estimated quantities that analysis of geologic and engineering data show with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions.

Reservoirs are considered proved if economic producibility is supported by actual production or conclusive formation test (drill stem or wire line), or if economic producibility is supported by core analyses and/or electric or other log interpretations.

**Proved Reserves of Natural Gas Liquids:** Proved reserves of natural gas liquids, as of December 31 of the report year, are those volumes of natural gas liquids (including lease condensate) that with reasonable certainty have been shown to be separable in the future from proved natural gas reserves under existing economic and operating conditions.

**Recoverable Reserves:** The amount of coal that can be recovered (mined) from the coal deposits at active, producing mines as of the end of the year.

**Recovery Factor:** The percentage of total tons of coal estimated to be recoverable from a given area in relation to the total tonnage estimated to be in the demonstrated reserve base. The estimated recovery factors for the demonstrated reserve base generally are 50 percent for underground mining methods and 80 percent for surface mining methods. More precise recovery factors can be computed by determining the total coal in place and the total amount of coal recoverable in any specific locale.

**Recovery Percentage:** The percentage of coal that can be recovered from the coal deposits at existing mines.

**Reserve:** That portion of the demonstrated reserve base that is estimated to be recoverable at the time of determination. The reserve is derived by applying a recovery factor to that component of the identified coal resource designated as the demonstrated reserve base.

**Residual Fuel Oil:** The topped crude of refinery operation that includes No. 5 and No. 6 fuel oils, Navy Special fuel oil, and Bunker C fuel oil. Residual fuel oil is used for the production of electric power, space heating, vessel bunkering, and various industrial purposes. Includes imported crude oil to be burned as a fuel.

**Short Ton:** A unit of weight equal to 2,000 pounds. All tonnages used in this publication are in short tons.

**Steam-Electric (Conventional) Plant:** A plant in which the prime mover is a steam turbine. The steam used to drive the turbine is produced in a boiler by heat from burning fossil fuels. (See **Fossil Fuel** and **Fuel**.)

**Surface Mine:** A mine producing coal that is usually within a few hundred feet of the earth's surface. Overburden (earth above or around the coal) is removed to

expose the coal bed. The bed is then mined using surface excavation equipment such as draglines, power shovels, bulldozers, loaders and augers. This type of mine may also be known as an **area, contour, open-pit, strip, or auger mine**.

**Underground Mine:** A mine tunneling into the earth to the coal bed. Underground mines are classified according to the type of opening used to reach the coal—i.e. **drift** (level tunnel), **slope** (inclined tunnel), or **shaft** (vertical tunnel).

**Unit Value, Wellhead:** Represents the wellhead sales price, including charges for natural gas plant liquids subsequently removed from the gas, gathering and compression charges, and state production, severance, and/or similar charges.

**Watt:** The electrical unit of power or rate of doing work. A watt is the rate of energy transfer equivalent to 1 ampere flowing under pressure of 1 volt at unity power factor (volt and ampere in phase). It is analogous to horsepower or foot-pound-per-minute of mechanical power. One horsepower is equivalent to approximately 746 watts.

**Watt-hour (Wh):** Equal to one watt of power supplied to, or taken from, an electric circuit steadily for one hour.

**SOURCES:** These definitions were compiled from the glossaries in the following U.S. Department of Energy, Energy Information Administration publications: *Coal Production* (EIA-0118), *Cost and Quality of Fuels for Electric Utility Plants* (EIA-0191), *Demonstrated Reserve Base of Coal in the United States on January 1, 1980* (EIA-0280), *Electric Power Annual* (EIA-0348), *Inventory of Power Plants in the United States* (EIA-0095), *Natural Gas Annual* (EIA-0131) and its predecessor publication, *Natural Gas Production and Consumption* (EIA-0131), *Petroleum Supply Monthly* (EIA-0109), and *U.S. Crude Oil, Natural Gas, and Natural Gas Liquids Reserves* (EIA-0216).

The definition of average megawatt is from the Northwest Power Planning Council, *Northwest Conservation and Electric Power Plan*, volume 1, 1983.

# ENERGY PRODUCTION AND CONSUMPTION

# 1

## HIGHLIGHTS

- Total production of energy in Montana was 820 trillion British thermal units (Btu) in 1987, down 8 trillion Btu from 1986.
- Coal accounted for most (73 percent) of the total energy produced in Montana in 1987. The rest of the energy produced was in the form of crude oil (17 percent), natural gas (6 percent), and hydroelectric power (4 percent).
- Montanans consumed 320.8 trillion Btu of energy in 1987 (the latest year for which figures are available). This is 2 percent more energy than was consumed in 1986.
- Industry, including agriculture, represented the largest consuming sector. In 1987 industry consumed 38 percent of the energy sold in Montana. Transportation, almost exclusively in the form of petroleum products, accounted for 37 percent of the consumption. The residential and commercial sectors consumed 14 percent and 11 percent, respectively, of the energy sold in Montana.

<sup>1</sup> Consumed at utilities to produce electricity.

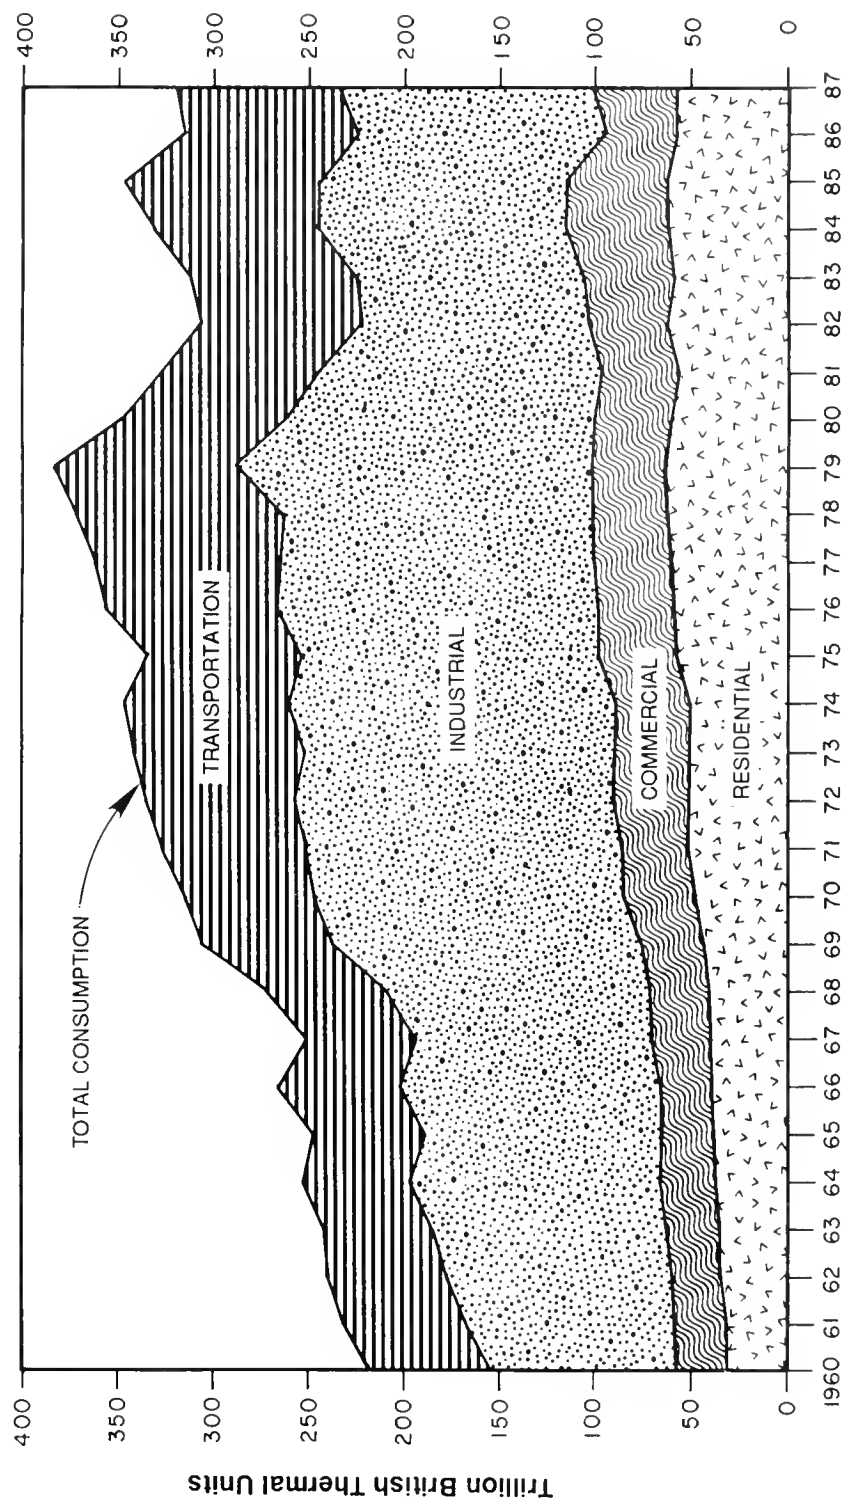

<sup>2</sup> Net interstate sales of electricity is the difference between the amounts of energy in the electricity sold within a state (including associated losses) and the energy input at the electric utilities within the state. The net interstate sales, therefore, include associated electrical energy losses. A positive number indicates that more electricity (including associated losses) came into the state than went out of the state during the year. Conversely, a negative number indicates that more electricity (including associated losses) went out of the state than came into the state.

NOTE: Due to the lack of consistent historical data, statistics exclude wood, waste, geothermal, wind, photovoltaic, and solar thermal energy (except for small amounts used by electric utilities to generate electricity for distribution).

<sup>1</sup> Consumed at utilities to produce electricity.

<sup>2</sup> Net interstate sales of electricity is the difference between the amounts of energy in the electricity sold within a state (including associated losses) and the energy input at the electric utilities within the state. The net interstate sales, therefore, include associated electrical energy losses. A positive number indicates that more electricity (including associated losses) came into the state than went out of the state during the year. Conversely, a negative number indicates that more electricity (including associated losses) went out of the state than came into the state.

NOTE: This table gives the Btu equivalent of the physical units shown in Table 1.3. In the source document, DOE uses fossil fuel equivalent conversion factors to convert kilowatt-hours of hydroelectric generation to British thermal units. The reader is cautioned that much of the electricity generated in Montana is produced at hydroelectric plants. Therefore, DNRC feels that the use of these conversion factors may result in an artificially high estimate of the amount of electrical energy consumed in Montana.

Does not include wood consumed by the nonutility sectors. Also excludes small quantities of other energy sources for which consistent historical data are not available, such as solar energy obtained by the use of thermal and photovoltaic collectors, wind energy, and geothermal, biomass, and waste energy other than that consumed at the electric utilities.

<sup>1</sup> Includes supplemental gaseous fuels.

<sup>2</sup> Incurred in the generation, transmission, and distribution of electricity plus plant use and unaccounted for electrical system energy losses.

<sup>3</sup> Due to the lack of consistent historical data, statistics exclude wood, waste, geothermal, wind, photovoltaic, and solar thermal energy (except for small amounts used by electric utilities to generate electricity for distribution).

\* Btu value less than 0.05, and physical unit value less than 0.5.

NOTE: In the source document, DOE uses fossil fuel equivalent conversion factors to convert kilowatt-hours of hydroelectric generation to British thermal units. The reader is cautioned that much of the electricity generated in Montana is produced at hydroelectric plants. Therefore, DNRC feels that the use of these conversion factors may result in an artificially high estimate of the amount of electrical energy consumed in Montana.

# ELECTRICITY

# 2

## HIGHLIGHTS

- With the beginning of commercial operation of the fourth Colstrip unit in 1985, total electric generating capacity in Montana jumped to 4,704 megawatts of which 49 percent is hydroelectric generating capacity and 51 percent is fossil fuel fired.
- Hydroelectric and fossil fuel plants generated 20.9 billion kWh in 1987, down 7 percent from the record high generation of 22.4 billion kWh in 1986.
- Montana's coal-fired plants produced 11.8 billion kWh of electricity in 1987, up 3 percent from the previous year.
- Electric utilities sold 12.6 billion kWh of electricity in Montana in 1987. Preliminary estimates show residential customers paid an average of 5.23 cents per kilowatt-hour, commercial customers paid an average of 4.68 cents per kilowatt-hour, and industrial customers paid an average of 2.72 cents per kilowatt-hour.
- In early 1988, the average Montana household consuming 1,000 kilowatt-hours of electricity per month paid \$57.88, while the average U.S. household paid \$74.15 for 1,000 kilowatt-hours of electricity.

<sup>1</sup> Unless otherwise specified, capacity denotes installed nameplate capacity

TABLE 2.1 (continued)

**NOTES:** **Champion International Corporation** (formerly Montana Light and Power Co.): The average generation figure for the thermal generating units at Libby is a twelve-year average based on operating 365 days per year, 24 hours per day during that period. Generation is largely for in-plant use at Champion International.

**U.S. Department of the Army, Missouri River Division, Corps of Engineers** Figures are based on the 08-83-1980 Reservoir Control Study (RCC). Fort Peck's dependable capacity (183 MW) is the load-carrying ability of the power plant based on the eighth year (1961) of drought drawdown (from RCC study 08-83-1980). The nameplate capacity (185 MW) is the total electrical rating of the generators and does not depend on adverse hydrologic conditions as does dependable capacity.

**U.S. Department of the Army, North Pacific Division, Corps of Engineers:** the present nameplate installed capacity at Libby is 525 MW based on the five existing units. The units at Libby have been designed to operate at 15 percent overload to provide maximum output during periods of high power demand. Thus, under certain conditions, when the reservoir level is between elevation 2,459 feet (full) and elevation 2,411 feet, Libby now can generate 604 MW.

The dependable capacity, defined as the maximum January output during adverse streamflow conditions, is 353 MW. Dependable capacity is used in load-resources planning studies to measure a project's or system's capability to meet winter peak demand. January has historically been the month when maximum power demand occurs. Adverse conditions are defined as the worst single year in the 40-year period of record from 1929-68 conventionally used by Northwest utilities. The water year 1936-37 had the worst streamflows and lowest generation capability in the period of record, this year is used to model dependable capacity.

**U.S. Department of the Interior, Bureau of Reclamation, Great Plains Region:** For planning purposes, the eastern and western marketing regions can count on receiving up to a maximum of 125 MW each from the Yellowtail Dam.

**U.S. Department of the Interior, Bureau of Reclamation, Pacific Northwest Region:** Although the nameplate capacity is 285 MW, the power plant is actually run at 328 MW. The Bureau of Reclamation expects to complete a rewind in 1993; the capacity will then be 448 MW.

The Bureau of Reclamation office reports a critical period generation of 96.0 average megawatts rather than a critical year figure for the Hungry Horse Dam, and the office reports a 40-year (1928-68) average generation of 108.0 average megawatts rather than a median water year figure.

**Washington Water Power Co.:** Energy generation for the critical water period assumes optimal coordinated operation of the reservoirs in the Northwest under streamflow and runoff conditions similar to those experienced during the four-year critical period from September 1928 through February 1932, the worst period on record. The maximum generating capacity is 554.0 MW; this is the peak output of the project with the reservoir full. Changes in reservoir elevation will affect the peak generating output.

**Montana-Dakota Utilities:** MDU prefers to use Uniform Rating of Generating Equipment (URGE) capacity ratings instead of nameplate capacities. URGE ratings are a generally accepted industry standard. URGE is a demonstrable and repeatable test for determining capacity ratings. Such ratings should be considered to be net maximum ratings.

The URGE capability test is an annual event. For this reason, URGE ratings may vary slightly from year to year. As a general rule of thumb, once a capability is established, it will remain essentially the same until operating procedures, upgrades, deratings, or some other such events change the rating.

MDU prefers to use a 1988 average generation figure determined by dividing the net total generation for 1988 by the total number of hours on-line. This computation results in the following figures:

Unit	Average Generation, 1988 (average MW/hour on-line)
Glendive	23.2
Lewis & Clark	27.0
Miles City	7.9

The Glendive and the Miles City units function as standby, emergency generation or peaking units.

**Montana Power Company:** MPC's energy and peak planning values represent net generating capabilities after maintenance.

**Montana Power Company:** The Frank Bird plant operates as a peaking unit. The Frank Bird plant's capacity is 60 MW net and the J.E. Corrette plant's capacity is 156 MW net. The annual energy generation at the J.E. Corrette plant is 125 average MW.

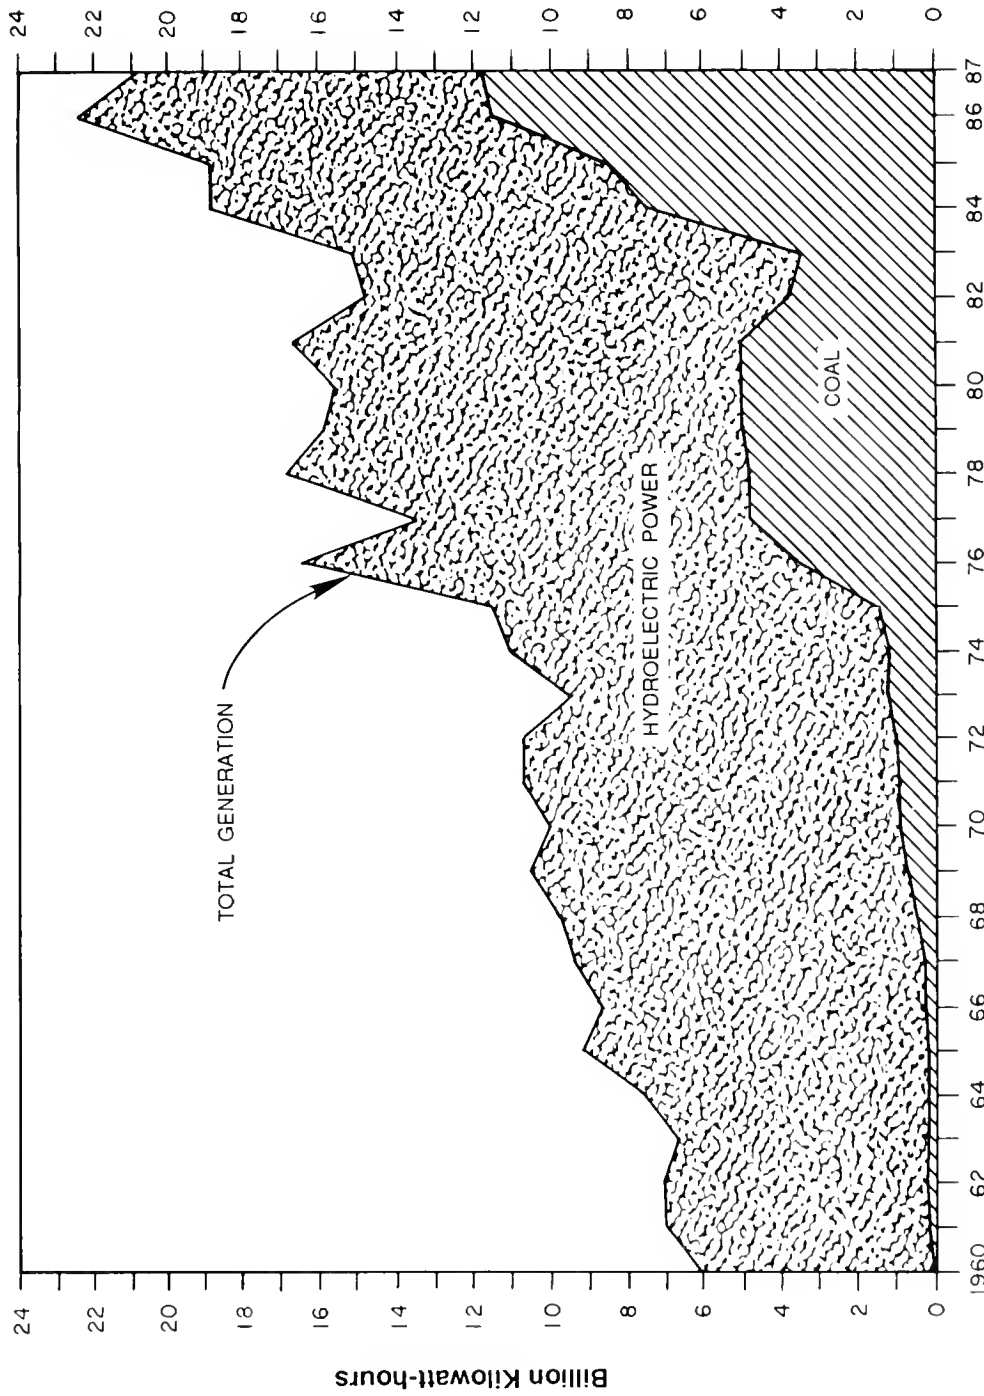

**Montana Power Company and Puget Sound Power and Light:** Colstrip units 1 and 2 have a 634 MW net capacity and a 491 average MW annual energy generation.

**Montana Power Company, et al:** Colstrip units 3 and 4 have a net capacity of 1440 MW and an estimated annual energy generation of 1124 average MW. MPC's share of Colstrip 4 is not used to serve its utility customers but has been sold off-system on long-term contracts.

**Montana Power Company:** In 1989, MPC was reviewing the generating capability of its Missouri River hydroelectric facilities.

**SOURCES:** Personal communications with the utilities and government agencies operating each power plant.

FIGURE 2.1 ANNUAL GENERATION OF ELECTRICITY, 1960-87

NOTE: Other fuel (Oil, Natural Gas, Wood and Waste) used to generate electricity are not shown because their contribution is negligible.

P: Preliminary

NOTE: In June 1979, DOE changed from reporting in thousands of kilowatt-hours to reporting in millions of kilowatt-hours. Accordingly, beginning in 1979, total annual figures are computed from figures rounded to the nearest million kilowatt-hours.

All 1981 figures have been revised due to a change in DOE reporting definitions; DOE revised the annual totals (but not the monthly detail figures) for the years 1976-1980 to reflect the new reporting definitions.

SOURCES: Federal Power Commission (1960-76); U.S. Department of Energy, Energy Information Administration, *Electric Power Statistics*, monthly reports for 1977-78 (EIA-0034); U.S. Department of Energy, Energy Information Administration, *Financial Statistics of Electric Utilities and Interstate Natural Gas Pipeline Companies*, monthly reports for 1979 through February 1980 (EIA-0147); U.S. Department of Energy, Energy Information Administration, *Sales, Revenue, and Income of Electric Utilities*, monthly reports for March 1980 through October 1981 (EIA-0147); U.S. Department of Energy, Energy Information Administration, *Electric Power Monthly*, monthly reports for November 1981 through December 1988 (EIA-0226).

Annual totals are revised based on information in the U.S. Department of Energy, Energy Information Administration, *Electric Power Annual* publications (EIA-0348).

NOTES: Beginning in August 1980, DOE changed from reporting in tons, barrels, and thousand cubic feet to reporting in thousand short tons, thousand barrels, and million cubic feet. Accordingly, beginning in August 1980, data are rounded to the nearest thousand short tons, thousand barrels, or million cubic feet.

SOURCES: Federal Energy Regulatory Commission (formerly Federal Power Commission), Form 4 News Releases (1960-76); U.S. Department of Energy, Energy Information Administration, *Electric Power Statistics*, monthly reports for 1977-78 (EIA-0034); U.S. Department of Energy, Energy Information Administration, *Power Production, Fuel Consumption and Installed Capacity Data*, annual report for 1979 (EIA-0049); U.S. Department of Energy, Energy Information Administration, *Preliminary Power Production, Fuel Consumption and Installed Capacity Data*, monthly reports for January-July 1980 (EIA-0005); U.S. Department of Energy, Energy Information Administration, *Electric Power Monthly*, monthly reports for August 1980 through December 1988 (EIA-0226).

Annual totals are revised based on information in the U.S. Department of Energy, Energy Information Administration, *Electric Power Annual* publications (EIA-0348).

NOTES: Based on data for the Montana Power Company.

Beginning in 1985, data is based on rates during utility-specified winter and summer periods.

Energy is metered on secondary side of utility-owned transformers.

# COAL

# 3

## HIGHLIGHTS

- One-quarter of the U.S. demonstrated reserve base of coal is in Montana. This includes 57 percent of the subbituminous coal and 35 percent of the lignite demonstrated reserve base.
- Surface mines in Montana produced 38,920,381 tons of subbituminous coal and lignite in 1988, up 13 percent from the previous year.
- Rosebud County is the leading coal-producing county in Montana. Rosebud County produced 19,940,573 tons of coal in 1988, followed closely by Big Horn County with 16,841,029 tons.
- The 1988 average mine price for Montana coal was \$11.59 per ton, down \$.77 per ton from the previous year.
- Approximately 76 percent of the coal mined in Montana is shipped out of state to steam-electric plants. In 1987 one-third of the coal mined was shipped to utilities in Michigan.
- Of the 10.8 million tons of coal consumed in Montana in 1988, 98 percent was used to generate electricity.

<sup>1</sup> Includes measured and indicated resource categories as defined by the Energy Information Administration and represents 100 percent of the coal in place.

<sup>2</sup> Eastern Kentucky is in the Appalachian coal producing region; western Kentucky is in the U.S. interior coal producing region. Because coal reserves are calculated by region, these figures are shown separately.

**NOTE:** The coal reserve base consists of coal in the ground that was considered to be technically and economically minable on January 1, 1988. The amount of coal that can be recovered from the reserve base is termed the reserve. Recoverability ranges from 40 to 90 percent, depending on the characteristics of the coalbed, the mining method, and restraints imposed on the mining operations by natural and manmade features and restrictions. On a national basis, at least half of the coal reserve base, more than 200 billion tons, was estimated to be recoverable.

State geological and mineral resource surveys and other geological reports were used to update the U.S. Department of Energy, Energy Information Administration's *Demonstrated Reserve Base of Coal in the United States on January 1, 1980* (EIA-0280). The update accounts for (1) depletion due to mining, (2) revisions based on new data sources determined to be suitable under demonstrated reserve base (DRB) criteria, and (3) adjustments using existing data sources in context with changes in DRB criteria or basic data interpretations.

# NATURAL GAS

# 4

## HIGHLIGHTS

- Proved reserves of natural gas were estimated by the U.S. Department of Energy to be 801 billion cubic feet as of December 31, 1987.
- Montana wells produced 53 billion cubic feet of natural gas in 1988, up 11 percent from the previous year.
- In 1988 the state's natural gas utilities reported sales of 35 billion cubic feet. Approximately three-fourths of this was used by residential and commercial customers.
- Residential gas customers paid an average of \$4.41 per thousand cubic feet (Mcf) while commercial customers paid an average of \$4.34 per Mcf and industrial customers paid an average of \$3.42 per Mcf in 1987. The state-wide average over all consuming sectors was \$4.16 per Mcf.
- The average residential customer consumed 91,000 cubic feet of natural gas at a cost of \$404 in 1987.

NOTE: All volumetric data presented in Chapter 4 are expressed using a pressure base of 14.73 pounds per square inch absolute (psia) at 60 degrees Fahrenheit. Conversions to this uniform pressure base were made by the Energy Division, Montana Department of Natural Resources and Conservation, where necessary.

NOTE: Proved reserves are the estimated amounts of natural gas that geologic and engineering data indicate are recoverable from known reservoirs under present economic and operating conditions. Natural gas is classified into two categories based on type of occurrence in reservoirs, as follows:

1. Nonassociated gas is defined as free natural gas not in contact with crude oil in the reservoir.
2. Associated or dissolved gas is the combined volume of natural gas that occurs in crude oil reservoirs either as free gas (associated) or as gas in solution with the crude oil (dissolved).

Since 1973, only the recoverable portion of natural gas in underground storage has been reported.

Joint American Gas Association, Canadian Petroleum Association, and American Petroleum Institute publication of the yearly reserves of natural gas and natural gas liquids ceased after 1979. Rather than develop independent reserve estimates, these organizations now publish the reserve estimates calculated by the U.S. Department of Energy, which are shown in Table 4.1A.

SOURCE: American Gas Association, *Gas Facts* (1950-79).

<sup>1</sup> Average wellhead price is computed by dividing the gross value of the gas produced by the volume produced

NOTE Oil and Gas Conservation Division production data are based on reports by gas producers, which exclude gas vented or flared and gas used in repressuring. Production equals the U.S. Department of the Interior, Bureau of Mines marketed production, except that some gas withdrawn from storage facilities in Montana may be included in the Oil and Gas Conservation Division data

Department of Revenue data are based on tax receipts received from industry

1987	16.8	10.6	6.0	<sup>1</sup>	1.4	34.7

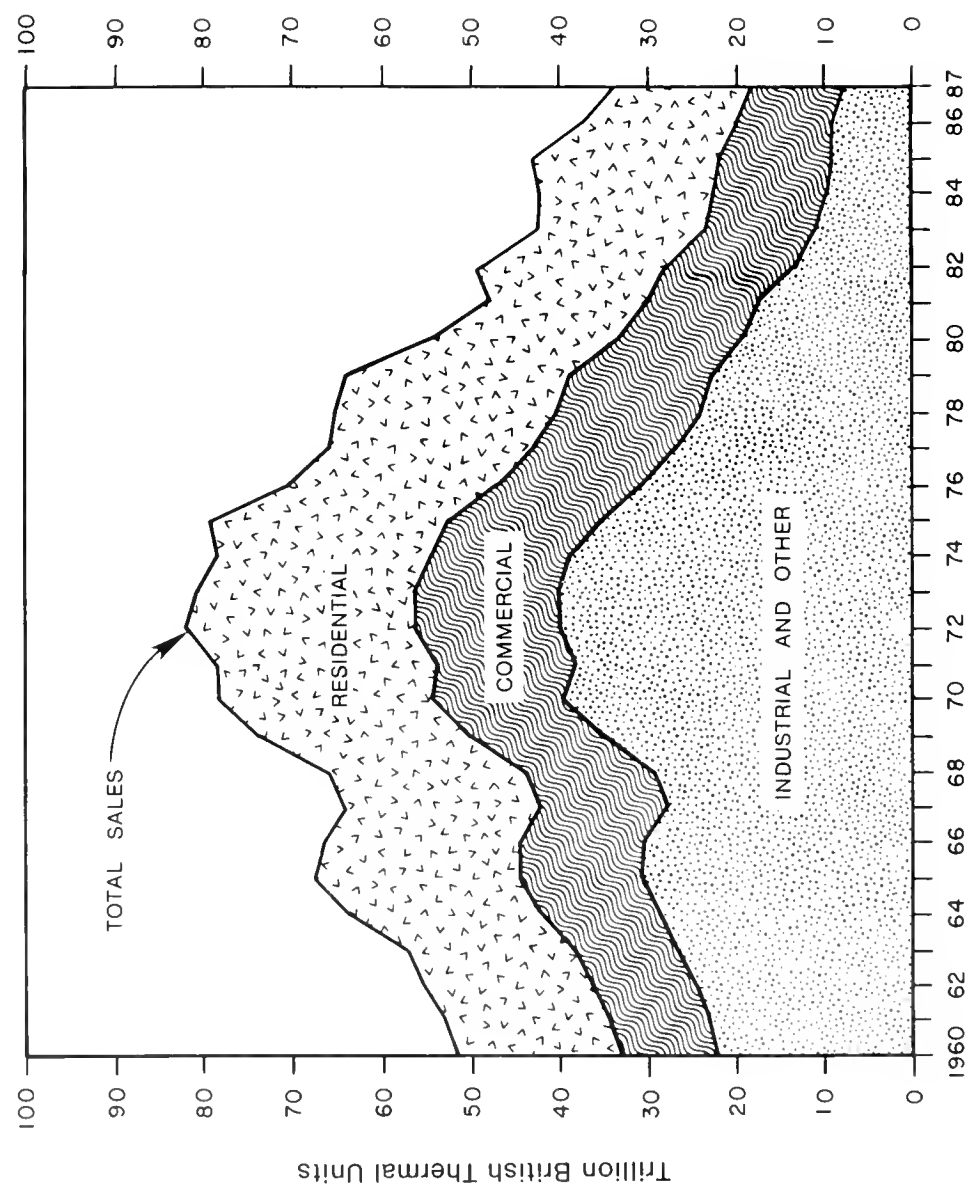

NOTE: These data cover sales of natural gas by utilities only and do not include sales directly from producer to end-user. In the United States direct sales make up a significant portion of total gas use, particularly in the industrial sector. In Montana, direct sales are not significant; hence, "total sales" is close to "total gas delivered." Prior to 1984 electric utility use of gas is included in the industrial sector.

Average heat content is highly variable, depending on elevation. Natural gas data converted to Btu, as in this table, are, therefore, only a rough approximation.

<sup>1</sup> Less than 0.05 trillion Btu.

NA Not available.

E Estimate.

**TABLE 4.5 (continued)**

- <sup>1</sup> Sales to other utilities for resale and sales of natural gas to Canada are not included.
- <sup>2</sup> From 1950 to 1970, government and municipal sales were reported in the "Residential and Commercial" sector.
- "Other" includes interdepartmental use, sales to government and municipal authorities for heating, and special off-line sales to firms in Montana where these figures are reported separately.
- <sup>3</sup> Prior to 1975 "Other" includes interdepartmental use and natural gas used in MDU's electric generating plants at Baker, Glendive, and Miles City. Company consumption and unbilled customer consumption as part of a lease agreement at Saco are not included.
- The 1975-81 data uses slightly different sector definitions; as a result, consumption in the "Other" sector is not shown separately for these years.
- Since 1982 "Other" includes interdepartmental sales.
- <sup>4</sup> "Other" includes sales to Malmstrom Air Force Base and other public authorities.
- <sup>5</sup> "Other Utilities" includes the following companies (listed in approximate descending order by volume of sales):
- |                             |   |
|-----------------------------|---|
| Cut Bank Gas Company:       | Supplies natural gas to Cut Bank; approximately 80 percent of its gas is purchased from the Montana Power Company.  |
| Shelby Gas Association:     | Supplies natural gas to Shelby; gas is purchased from the Montana Power Company.  |
| Consumers Gas Company:      | Supplies natural gas to Sunburst and Sweetgrass; gas is purchased from the Montana Power Company and the J.R. Bacon Drilling Company through the Treasure State Pipeline Company. |
| Saco Municipal Gas Service: | Supplies natural gas to Saco from the town's own wells.   |
- Some of the smaller natural gas utilities have experienced problems measuring actual sales volumes. Therefore, the figures for these utilities should be considered estimates.
- <sup>6</sup> All gas sales from "Other Utilities" are included under "Residential and Commercial."
- The definition of "Other" varies from utility to utility and from year to year, as indicated.

**NOTE:** Source documents from the Public Service Commission often report data at sales pressure rather than at a uniform pressure base. When necessary, the data were converted to the uniform pressure base of 14.73 psia at 60 degrees Fahrenheit using Boyle's law.

The source reports are for the companies' fiscal years ending during the year shown. Because reporting years vary from utility to utility, the data represent various twelve-month periods and are, in that sense, not strictly comparable.

The Saco Municipal Gas Service and the Cut Bank Gas Company have reporting years ending June 30. The Shelby Gas Association's reporting year ends September 30. The Consumer Gas Company, the Montana Power Company, and Montana-Dakota Utilities use calendar year reporting periods.

The Great Falls Gas Company used a calendar year reporting period through 1981; they filed a six-month report for the period January 1, 1982, through June 30, 1982, and then changed to a twelve-month reporting period ending June 30.

Through 1981, Great Falls Gas Company figures are based on reports for the twelve months ending December 31 of that year. The 1982 figures were estimated by the sector averages from the 1981 and 1983 twelve-month reports. The 1983 figures and those for all subsequent years are based on twelve-month reports ending June 30 of that year.

**SOURCE:** Annual reports filed with the Montana Public Service Commission by the natural gas utilities (1950-88), supplemented by information obtained directly from the utilities.

<sup>1</sup> Gross Withdrawal is defined as marketed production, plus quantities used in repressuring, plus quantities vented and flared from both gas wells and oil wells.

<sup>2</sup> Marketed Production represents gross withdrawals of natural gas from gas and oil wells, less gas used for repressuring, nonhydrocarbon gases removed, and quantities vented and flared.

For 1979 and prior years, the volumes of nonhydrocarbon gases included in marketed production were not reported. For 1980 and 1981, the amount of nonhydrocarbon gases removed was not available for the Montana data, so DOE used the same figure for Montana's marketed production including nonhydrocarbon gases as is used for marketed production excluding nonhydrocarbon gases.

<sup>3</sup> Consumption is defined as total gas delivered to consumers, plus lease and plant fuel, plus pipeline fuel.

<sup>4</sup> Industrial use includes refinery use of gas, but excludes pipeline fuel.

<sup>5</sup> Other Consumers includes delivery to municipalities and public authorities for institutional heating, street lighting, etc. This category was not used before 1967; it was included in Industrial Consumption before that year. This category was merged with the Commercial category in 1982.

1987	180.0	NA	441.0	434.0	342.0	416.0

<sup>1</sup> Average prices were computed by dividing the annual value of natural gas by the annual volume of natural gas.

<sup>2</sup> Average wellhead prices were computed using the marketed production figure for natural gas.

In 1980 Montana reported the value associated with gross withdrawals to DOE and, thus, the average value of the gross withdrawal volume was used as the average wellhead value. This is probably the case in other years as well

<sup>3</sup> Average retail prices were computed using the consumption figure for natural gas.

NOTE Other Consumers were included in the Industrial category prior to 1967. From 1967 to 1981, Other Consumers were not reported separately, but were included in the overall average figure shown in the All Consumers category. Other Consumers are included in the Commercial category beginning in 1982

Data from electric utilities are not shown separately but are included in the All Consumers category.

NOTE Since this compilation includes cycling plants reprocessing pipeline gas, totals shown here for gas throughput do not relate directly to government data on total gas processed or sold. Similarly, liquids production figures are based on yearly average and do not necessarily reconcile with government data.

# CRUDE OIL AND PETROLEUM PRODUCTS

# 5

## HIGHLIGHTS

- Montana's proved reserve of crude oil was estimated by the U.S. Department of Energy to be 246 million barrels as of December 31, 1987. The Oil and Gas Conservation Division of the Montana Department of Natural Resources and Conservation estimated the reserves at 189 million barrels, three-fourths of which were located in the Williston Basin.
- Twenty-five million barrels of crude oil were extracted in 1987. This is 2 million less than in the previous year.
- The average wellhead price of oil was \$16.62 per barrel in 1987, up 23 percent from the previous year.
- Montana refineries processed 43 million barrels of crude oil in 1987, up 1 percent from the previous year.

<sup>1</sup> Proved reserves are the estimated amount of oil that geologic and engineering data indicate is recoverable from known reservoirs under present economic and operating conditions.

NOTE The American Gas Association (AGA) ceased making independent crude oil reserve estimates in 1979. Beginning in 1980, the AGA reported the reserve estimates calculated by DOE. Both DOE and AGA figures for 1976-79 are shown for comparison purposes.

<sup>E</sup> Two of the source publications were biennial rather than annual, and in each of these publications there was only one estimate of the crude oil reserves. Crude oil reserves for the two "missing" years have been interpolated from data values in the adjacent years.

<sup>1</sup> The regions shown correspond to the following geological basins:

North	Sweetgrass Arch and Bearpaw Uplift
Northeast	Williston Basin
Central	Big Snowy Uplift
South Central	Big Horn Basin
Southeast	Powder River Basin

<sup>2</sup> The Oil and Gas Division acknowledges discrepancies between the sum of the regional reserve estimates (where the region estimates are aggregates of individual field reserve estimates) and the reported statewide reserve estimate. However, these differences are only a very small proportion of the statewide estimate.

SOURCE: Montana Department of Natural Resources and Conservation, Oil and Gas Division, *Annual Review*, 1955-88.

<sup>1</sup> Average wellhead prices were computed by dividing the gross value of production by the number of barrels extracted

<sup>2</sup> SOURCES: Montana Department of Natural Resources and Conservation, Oil and Gas Conservation Division, *Annual Review*, 1950-87. The Oil and Gas Division acknowledges a difference in its data for the amount of Montana oil available for refining in Montana (calculated as the amount of oil produced in Montana less the amount of Montana oil exported) and the amount of Montana oil delivered to refineries in Montana. Some of this oil is either used or lost at the various stages between producing and refining.

<sup>3</sup> U.S. Department of the Interior, Bureau of Mines, Mineral Industry Surveys, *Crude Petroleum, Petroleum Products, and Natural Gas Liquids*, annual reports for 1950-75; U.S. Department of Energy, Energy Information Administration, *Crude Petroleum, Petroleum Products, and Natural Gas Liquids*, annual reports for 1976-80 (EIA-0108); U.S. Department of Energy, Energy Information Administration, *Petroleum Supply Annual*, annual reports for 1981-87. DOE no longer publishes information on wellhead prices

<sup>R</sup> Revised

<sup>1</sup> Includes 9,000 barrels from South Dakota in 1954 and 13,000 barrels from South Dakota in 1955

NOTE: Data originally reported by the Montana Oil and Gas Conservation Division have been revised on the basis of further information received from individual refineries. The Oil and Gas Conservation Division data originally understated Canadian inputs and overstated Wyoming inputs to the Continental Oil refinery, at least for the years 1968-75. Canadian inputs to the Big West Oil and Westco refineries were apparently not reported to the Oil and Gas Conservation Division. Revised data are available only for the years 1972-75, but it is likely that Canadian inputs to these two refineries were significant before 1972.

SOURCE: Montana Department of Natural Resources and Conservation, Oil and Gas Conservation Division, *Annual Review*, 1953-88.

**FIGURE 5.2 REFINERY RECEIPTS BY SOURCE OF CRUDE OIL, 1960-87**

NOTE: Crude oil received from North and South Dakota is not shown due to its small volume

NOTE: Motor fuel is defined as all gasoline covered by state motor fuel tax laws plus diesel fuel and LPG used in the propulsion of motor vehicles. Military use of motor fuel and all aviation fuel use are excluded in the Department of Transportation data. Figures for highway use of fuels may be understated because of refunds given on fuel for nonhighway use such as agriculture.

NOTE: Commercial marketing of Montana-produced gasohol began in October 1981. Prior to that time, most of the gasohol in Montana was imported. Since late 1981, there has been very little interstate shipment of gasohol; therefore, the amount of gasohol produced in Montana should be closely approximated by these consumption figures.
